Agenda

- Scope
- Deliverables
- Progress

Quantum Circuit Born Machines

QCBMs are generative models that use quantum circuits to represent probability distributions.

Project # 64

This project aims at developing a set of tools for implementing Quantum Circuit Born Machines using Qiskit.

Deliverables

Minimal Viable Product (MVP):

A jupyter notebook serving as a primer on QCBMs with examples of their implementation in the framework of Qiskit patterns.

Primary Deliverables

- A python module based on Qiskit for the implementation of QCBMs.

Primary Deliverables

- A python module based on Qiskit for the implementation of QCBMs.
- A set of jupyter notebooks implementing use cases of QCBMs within the qiskit patterns framework.

Primary Deliverables

- A python module based on Qiskit for the implementation of QCBMs.
- A set of jupyter notebooks implementing use cases of QCBMs within the qiskit patterns framework.
- A report on example performance metrics and comparisons with classical counterparts as benchmarks.

Approach

- Review of the state of the art
 - Theory & Implementations
- Recast the above within
 - Qiskit 2.x & Qiskit Patterns

Our methodology so far...

- Implementation of various components as functions.

Our methodology so far...

- Implementation of various components as functions.
- Various initial experiments.

Next Steps

- Run larger experiments in current hardware.

Next Steps

- Run larger experiments in current hardware.
- Structure the implemented tools as a module.

Next Steps

- Run larger experiments in current hardware.
- Structure the implemented tools as a module.
- Report on example performance metrics.
